

# **SourceTree**

## **Overview**

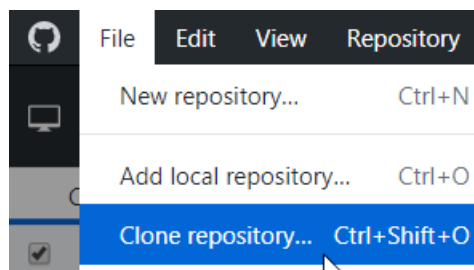

- Git and the command line can be a very annoying and complicated
- Luckily there are multiple Git GUIs, which work across a variety of platforms such as, OSX, Windows, and Linux.
- This should only simplify our Git work, and is not instead of what we learned.
- There are a lot of Git GUI tools out there, we are going to use Github desktop

## Steps:

1. Go to <https://desktop.github.com/> and download Github desktop

2. Once installed we can clone our remote repository follow the following steps:
  - a. File → Clone repository

- b. Find your project / use the .git URL (from Github)
- c. Choose a local directory (default is good too).
- d. Press clone and wait for it to finish
